T-cell receptor beta chain V-D-J region (140-1AL) - mouse (fragment)
C.Species: Mus musculus (house mouse)
C.Species: Mus musculus (house mouse)
C.Date: 17-Jul-1992 #sequence_revision 17-Jul-1992 #text_change 30-May-1997
C.Accession: PT0676
R.Feering A.J.15-124, 1991
A.Fitle: Junctional sequences of fetal T cell receptor beta chains have few N regions A.Reference number: PT0679; MUID:91277601
A.Recession: PT0676
A.Status: translation not shown
A.Status: Lanslation not shown
A.Status: Trenslation of shown
A.Residues: 1-7 <FEE>
A.Status: C.Seywords: T-cell receptor

The present invention describes peptides (A) that comprise agonists (Ia) or antagonists (Ib) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating astrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune CEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  T cell epitope; immune response; human leukocyte antigen; HLA Class I; vaccine; immunogenic; major histocompatability complex; MHC; B cell; disease; anti-tumour; anti-viral.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    or antigonists (ID) of human carcinoembryonal antigon (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (ID) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune cearcinon to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes peptides (A) that comprise agonists (Ia)

Sequences shown in W70044 to W70052 represent peptides derived from carcinoembryonic antigen (CEA). The peptides can bind to a human carcinoembryonic antigen (CEA). The peptides can bind to a human of inwortien (HLA), HLA-A2.1 and are used to exemplify the method of invention of producing antigen-specific cytotoxic T cells (CTLs) in vitro. The method comprises contacting immunogenic peptides from an antigen that binds class I major histocompatibility complex (MHC) molecules with antigen presenting cells (APCs) pretreated with prefreatment growth factors, and incubating the APCs with purified CDB cells in the presence of at least 2 incubation growth factors, thereby producing antigen-specific CTLs. A method for specifically killing target cells in a human patient is also provided which comprises obtaining a fluid sample containing CTLs from a patient, contacting the cytotoxic T cells with APCs pretreated with pre-treatment growth factors,
depleted mutants of a native disease-specific CTL epitope. The cysteine-depleted CTL epitopes elicit a stronger or more specific CTL response than the native epitope. The epitopes can be used in a disease-specific immunogen to protect a mammal against disease in particular melanomas. The peptides may also be used to screen a sample for the presence of an antigen with the same epitope, or with a different cross-reactive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; human leukocyte antigen; HLA; tumour associated antigen; cancer; antigen presenting cell; APC; immunogenic peptide; immuno disorder; viral infection; AIDS; hepatitis; bacterial infection; malaria; CEA; fungal infection; tuberculosis; melanoma; carcinoembryonic antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Production of antigen-specific cytotoxic T cells - by incubating fimunogenic peptide(s) from antigen that binds class I major histocompatibility complex molecules with pre-treated antigen presenting cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CEA derived HLA-A2.1 binding peptide 2 (residues 605-613).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Southwood S,

                                                                                                                                                                                Immunogenic T-cell peptide epitopes present in polypetide entigens. The method involves the identification of peptide sequences capable of binding to an HLA (human leukocyte antigen) class I molecule and measuring the binding of this epitope peptide to the HLA class I peptide. The stability of binding of the peptide and MHC (major histocompatability complex) class I molecule is measured on intact human B cells carrying the MHC molecule at their cell surfaces. The method can be used to select peptide epitopes for generating vaccines against a disease associated with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially T-cell peptide epitopes with strong anti-tumour and anti-viral immune responses. Peptide W39723 is derived from the human carcino-embryonic antigen (CEA) and has the ability to bind to the human MHC Class I allele HLA-A2.1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The peptide epitope W77119-W77138 were created for human tumour-specific cytotoxic T lymphocyte response. These peptides are are cysteine-

The immunogenic known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes can bind to a specific HLA b or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound care particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) corpressible cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to calicit an immune response in individuals susceptible or otherwise at risk of viral infection or
                                                                                                                                                                        ö
where the APCs comprise class I MHC molecules. The pretreated APCs are incubated with the cytotoxic growth factors, thereby producing activated CILs which are contacted with a carrier to form a composition. The composition can then be administered to the patient. The activated CILs can be used for treating cancers, immune disorders, viral infections, AIDS, hepatilts, bacterial infection, fungal infection, malaria or

(Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific findmune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA epitopes. The present sequence (I) and sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes peptides (A) that comprise agonists (Ia)
                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLS ex vivo for infusion back into a patient. The polynuclectides encoding the immunogenic peptides are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Carcinoembryonic antigen; CEA; human; agonist; antagonist; immune response; carcinoma; gastrointestinal; breast; pancreatic; bladder; ovarian; lung; prostatic; T cell proliferation; cancer; adoptive transfer therapy; autoimmune reaction; immunotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                 ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide agonists and antagonists of carcinoembryonal antigen
                                                                                                                                                                                                                                                                                                                                     Score 40; DB 20; Length 9;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes peptides (A) that comprise agonists (Ia) or antagonists (Ib) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Peptides Y54171-Y54236 represent immunogenic peptides comprising an allele-specific binding motif for the major histocompatibility complex conflowed residues at cartain positions such as positions 2 and 9. Also, the peptides do not comprise negative binding residues at other positions, such as positions 1, 3, 6 and/or 7 (peptides 9 mino acids long) and at poisons 1, 3, 4, 5, 7, 8 and/or 9 (peptides 10 amino acids long). The peptides are used to induce a cytotoxic T cell response to a preselected antigen. The method comprises contacting cytotoxic T cells from a patient (optionally expressing a specific MHC class I allele) with the present peptides. The peptides are used to treat and prevent microbial infection (e.g. treat peptides are used to treat and prevent microbial infection (e.g. treat peptides are used to treat and condyloma acuminatum) and cancer (e.g. prostate cancer, renal carcinoma, cervical carcinoma, lymphoma). Cytomegalovirus (CWV), malaria, and condyloma acuminatum) and cancer (e.g. prostate cancer, renal carcinoma, cervical carcinoma, lymphoma). Comprises in the acute phase of infection can be treated with the comprise phase of infection can be treated with the compression of the conventions of the respond to conventional corbacterial) or tumours in patients that do not respond to conventional corbacterial) or tumours in patients that do not respond to conventional corporations and an antibuted are useful as potential diagnostic or therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

Producing carcinoembryonic antigen (CEA) specific human cytotoxic rels (CTC), comprises introducing a 1st pox virus vector, having at least 1 insertion site containing a DNA segment encoding a CEA peptide (i.e. the present peptide) to a host to stimulate CTC production, and at least 1 periodic interval after that, contacting production, and at least 1 periodic interval after that, contacting the host with an additional antigen. The CEA specific CTC can be used to determine the CTC eliciting epitope of CEB, and to screen for compounds which enhance the ability of the antigen to create a introducing the CTC to the host, and at least 1 periodic interval after that introducing a CEA peptide, i.e. the present peptide is positive for binding to HiA-A2, and scored appropriate peptide results in the upresulation of surface HIA-A2 on the T2 cells, which can be quantified via FACScan using an anti-HIA-A2 antibody (background 280 and 300).
                                                                                                                                                                                                                                                                                          Generation of human cytotoxic T-cells specific for CEA - useful in therapy, epitope mapping and drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; rheumatoid arthritis; RA; diagnosis; RPI; RADF; detection; rheumatoid arthritis diagnostic feature; ERPI; synovial fluid; rheumatoid arthritis diagnostic protein isoform; screening; expression reference protein isoform; prognosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            or antagonists (Tb) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific firmune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA expressing cells). (Ia) are more active than native sequence (I) and generated recognize both (Ia) and native CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA express. The present sequence represents a specifically claimed example of (Ia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes peptides (A) that comprise agonists (Ia)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                        Carcinoembryonic antigen; CEA; human; agonist; antagonist; immune response; carcinoma; gastrointestinal; breast; pancreatic; bladder; ovarian; lung; prostatic; T cell proliferation; cancer; adoptive transfer therapy; autoimmune reaction; immunotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide comprising residues 571-579 of Carcinoembryonic antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide agonists and antagonists of carcinoembryonal antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Carcinoembryonic; antigen; human; cytotoxic T cell; pox virus vector; epitope; determination; screening; tumour; treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Length 9;

Immunogenic peptide having a human leukocyte antigen binding motif #1673
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Y45390 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cance; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases
                                                                                                                                                                                                                                         The present peptide was used in the preparation of a novel melanoma specific immunogen, comprising at least 1 melanoma specific cytocoxic T lymphocyte (CTL) epitope, where at least 1 of the epitopes is substantially homologous to a human leukocyte antigen-Al (HLA Al) and HLA A3 restricted epitope of a melanoma antigen, either pMEL-17 or tyrosinase. The immunogen can be used in vaccines for protection against melanoma in mammals.
                                                                                                                                      Melanoma-specific immunogens of pMel-17 and tyrosinase - useful in vaccination for producing melanoma-specific cytotoxic T lymphocytes

                                                                                                                                                                                                                                       archod has been developed for the diagnosis of human rheumatoid archifits (RA) using two-dimensional electrophoresis to generate a two-dimensional array of features. The method can be used for screening, diagnosis and prognosis of RA in a subject or for monitoring the effect of an anti-RA drug or therapy administered to a subject. The method comprises: (a) analysing a sample of serum or plasma and optionally synovial fluid by two-dimensional electrophoresis, to generate a two-dimensional array of features: (b) identifying at least one chosen clamens whose relative abundance correlates with the presence or absence of RA; and (c) comparing the abundance of each chosen feature in the sample with the abundance of that chosen feature in serum or plasma from one or more persons without RA, where the relative abundance of the chosen feature of features in the sample indicates the presence or absence of RA in the subject. The method can also be used in clinical studies for testing drugs for therapy of RA, for purification of antibodies to RPIS. The RA-diagnostic feature (RADF) proteins can be used to identify compounds that promote or inhibit their activity, which are then used as RA drugs. Nucleic acid encoding RADFs can be used in gene therapy proteonically and second in special and second in compounds that expensent expressent expressent expressent expressent expressent invention. RPIS, which are all used in class the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

HIA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are cormally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapetuically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell conditions and account or concerns to the peptide e.g. to concerns the conditions of the conditions or content or content or concerns the conditions of the conditions or concerns the conditions of the conditions or concerns the conditions or concerns the conditions or concerns the conditions of the conditions of the conditions of the conditions of the conditions or concerns the conditions of the

Sequences shown in W70077 to W70086 represent methionyl-tRNA (Met-tRNA) synthetase fragments from different bacterial species. These are used for designing degenerate primers (W43887) to W48800) used for isolating Met-tRNA sythetase gene fragment by PCR from M. tuberculosis and M. whereten a special manioacyl-tRNAS (atRNA) and M. which can be annotacyl-tRNAS (atRNA) (especially Met-tRNA) synthetase under control of transcriptional signals that can be used for the recombinant production of mycobacterial amino acyl tRNA synthetases, especially of methionyl tRNA synthetase. The enzymes are used by the organism in protein synthesis, and as such, the recombinant enzyme can be used to ofdentify candidate drugs for use as antibitotics towards mycobacteria, especially M. tuberculosis, which is responsible towards mycobacteria, especially M. tuberculosis, which is responsible used in antisense inhibition of the synthetase gene. The recombinant enzyme allows quick assays in screening of antibiotics. Present testing sections their enzyme allows quick assays in screening of antibiotics. Present testing seeing their effect. This is time consuming as the bacteria are generally solve with pathogenic strains.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Activities (RA) using two-dimensional electrophoresis to generate a arthritis (RA) using two-dimensional electrophoresis to generate a two-dimensional array of features. The method can be used for screening, diagnosis and prognosis of RA in a subject or for monitoring the effect of an anti-RA drug or therapy administered to a subject. The method comparises: (a) analysing a sample of serum or plasma and optionally synovial fluid by two-dimensional electrophoresis, to generate a two-dimensional array of features (b) identifying at least one chosen (c) comparing the abundance of each chosen feature in the sample with the abundance of each chosen feature in the sample with the abundance of each chosen feature in the cone or more persons without RA, where the relative abundance of the chosen feature of features in the sample indicates the presence or absence of RA in the subject. The method can also be used in clinical studies for testing drugs for therapy of RA, for purification of RA-diagnostic protein isoforms (RPIS), and for production of antibodies to RPIS. The RA-diagnostic feature (RADF) proteins can be used in clinical compounds that promote or inhibit their activity, which are then used as CR A drugs. Nucleic acid encoding RADFs can be used in gene therapy corporations for the present RPI peptides and 225066 to protocols. Y41804 to Y42101 represent expression reference protein isoform peptides and 225066 to the exemplification of the present invention.
                                                                                                                                                                                                                                                                          RA; diagnosis; RPI; RADF; detection;

Based on the similarity in the phospholipase A2 inhibitory activity of lipocortin and N-lipocortin and the similarity in the protein and the similarity in the protein and the similarity in the protein and the protein and the protein and the similarity in the protein and sequences, it was concluded that the two proteins represent a family of related proteins. There is ca. 60% homology.

The protein can be used for reducing inflammation or treating antituitic, allergic, dermatologic, opthalmic and collagen diseases and other diseases involving inflammation processes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Bacteriol, 170, 1658, 1988. The peptide inhibits the adhesion of P. gingivalis to saliva coated surfaces, and is therefore useful for preventing periodontitis by application to teeth and gums, esp. in dentifrices, mouthwashes or topical formulations, or by admin. as a P. vaccine. In an assay to determine the effect of the peptide on P. gingivalis binding to saliva coated hydroxapatite beads, the approx. 30 %.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New transgenic plants with increase trehalose contents - prepd. by transforming plants with a trehalose-6-phosphate synthase gene fused to a non-constitutive promoter
                                                                     Peptide inhibitor of Porphyromonas gingivalis adhesion to saliva coated surface - useful for preventing periodontitis by application to the teeth and gums esp. in dentifrices, mouth:washes or topical formulations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tryptic peptide; trehalose-6-phosphate synthase; M. smegmatis; probe

This enzyme allows the microorganism to utilise 3.3,3-trifluoro-2-hydroxy-2-methyl propionamide as its sole nitrogen source. This amidohydrolase is used in a process for preparing (R)-lsoforms of 3.3,3-trifluoro-2-hydroxy-2-methyl propionamide which is cheaper than prior art ortical resolution of the racemate using dimethoxy strychnine or (S)-(-)- alpha -methylbenzylamine.
                                             Plant with increase trehalose content. Tre6p in M. Smegmatis is heparin-activated and was isolated and purified. These peptides were derived from a protein which was purified with a mol. wt. of 55 kD which shared antigenic determinants with the yeast Tre6p synthase protein. Using these peptides probes may be designed for the isolation of the Tre6p gene (TSP1) for the production of the Transgenic plants. The trehalose may be isolated from the transgenic plants and used in bulk preparation including the preservation of the flavour and structure of food stuffs during drying. Fruits and berries form the transformed plants may be processed into purees, jellies and jams which have a fresher and richer flavour due to the increased
                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Tri:fluoro-2-hydroxy-2-methyl-propionic acid enantiomer preparation - by stereoselective hydrolysis of corresponding racemic amide using microorganism or derived enzyme, used as drug intermediate
derived from trehalose-6-phosphate (Tre6P) synthase from M. smegmatis. Tre6P is the key enzyme in the synthesis of trehalose via Tre6P. The aim of the invention is to produce a transgenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           R-specific amidohydrolase; hydrolysis; racemate; nltrogen source; 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide; isoform.

having a human major histocompatibility complex (MHC) Class I (also having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA-B or C) and induce a cytotoxic T cepponse against the antigen from which the peptide is derived.

The A-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in flighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma.

They can be administered as vaccines to elicit an immune response in cancindiduals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic relations. They contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents an enzyme inhibitor peptide used in the method of the invention to distinguish between t-pa and u-pa. The present invention describes a substrate subtraction library for the dentification of peptide substrates selective between a first enzyme (E1) and a second enzyme (E2), comprising a collection different peptides, substantially lacking peptides that are effective substrates for E1. Also described are: (1) amethod (M1) for identifying peptide substrates selective between a first enzyme (E1) and a second enzyme (E2); (2) a compound comprising the amino acid sequence of a peptide identified by M1; (3) a polypeptide for use as an enzyme inhibitor comprising one of 237 amino acid sequences (see W56801 to W5038); (4) a recombinant DNA vector comprising DNA (1) encoding a protease inhibitor including the sequence identified by the M1; (5) a prokaryotic or eukaryotic cell containing the vector of (4); (6) an antibody (Ab) immunoreactive with at least one of the peptides identified by M1; and (7) a diagnostic assay for distinguishing between active and latent forms of protease inhibitors, that uses (Ab). The forms of anymes inhibitors, that uses (Ab). The

(Ab) are used for affinity purification of recombinant peptides and in the identification of naturally occurring protease inhibitors. Enzyme-inhibiting peptides identified can be used to treat a serpin deficiency or a disorder of serine proteases.

arthritis (RA) using two-dimensional electrophoresis to generate a two-dimensional array of features. The method can be used for screening, diagnosis and prognosis of RA in a subject or for monitoring the effect of an anti-RA drug or therapy administered to a subject. The method comprises: (a) analysing a sample of serum or plasma and optionally synovial fluid by two-dimensional electrophoresis, to generate a two-dimensional array of features: (b) identifying at least one chosen feature whose relative abundance of each chosen feature in the sample with the abundance of each chosen feature in the sample with the abundance of that chosen feature in plasma from one or more persons without RA, where the relative abundance of the sample indicates the presence or absence of RA in the subject. The method can also be used in clinical studies for testing drugs for therapy of RA, for purification of RA-diagnostic feature (RADF) proteins can be used to identify compounds that promote or inhibit their activity, which are then used as RA drugs. Nucleic acid encoding RADFs can be used in gene therapy compounds that promote or inhibit their activity, which are then used as processent expression reference protein isoform peptides and 225066 to 225068 represent expression reference protein isoform peptides and 125066 to the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             arthritis (RA) using two-dimensional electrophoresis to generate a ruthritis (RA) using two-dimensional electrophoresis to generate a two-dimensional array of features. The method can be used for screening, diagnosis and prognosis of RA in a subject or for monitoring the effect of an anti-RA drug or therapy administered to a subject. The method comprises: (a) analysing a sample of serum or plasma and optionally synovial fluid by two-dimensional electrophoresis, to generate a two-dimensional array of features; (b) identifying at least one chosen feature whose relative abundance correlates with the presence or absence of RA, and (c) comparing the abundance of each chosen feature in the sample with the abundance of that chosen feature in serum or plasma from one or more persons without RA, where the relative abundance of the chosen feature in serum or plasma from one or more persons without RA, where the relative abundance of the chosen feature in classification of the chosen feature or features in the sample indicates the presence or absence of RA in the subject. The method can also be used in clinical studies for testing drugs for therapy of RA, for purification of RA-diagnostic feature (RADF) proteins can be used to identify compounds that promote or inhibit their activity, which are then used as RA drugs. Nucleic acid encoding RADFs can be used in gene therapy proteocls. Y41844 to Y42100 represent RPI peptides, Y42101 to Y42103

                                                                                                                                                                                                                                                                                                                                 The present sequence represents an enzyme inhibitor peptide used in the method of the invention to distinguish between t-PA and u-PA. The present invention describes a substract subtraction ilbrary for the identification of peptide substrates selective between a first enzyme (E1) and a second enzyme (E2), comprising a collection different substrates selective between a first enzyme (E1) and a second enzyme (E2); (2) a compound comprising the amino acid sequence of a peptide substrates selective between a first enzyme (E1) and a second enzyme (E2); (2) a compound comprising the amino acid sequence of a peptide identified by M1; (3) a polypeptide for use as an enzyme inhibitor comprising one of 237 amino acid sequences (see W56801 to W56947, and W56949 to W57038); (4) a recombinant DNA vetor comprising DNA (1) encoding a protease inhibitor including the sequence identified by the missing one of 237 amino acid sequence identified by the encoding a protease inhibitor including the sequence identified by the missing perveen and latent forms of protease inhibitors, that uses (Ab). The control of a dispossite assay for distinguishing between citive and latent forms of proteases inhibitors, that uses (Ab). The control of an encoding a proteases inhibitors, e.g. proteases, kinases and phosphatases. The identification of naturally occurring protease inhibitors. Enzymethe inhibiting peptides identified can be used to treat a serpin deficiency or a disorder of serime proteases.

R59104-264 are immunogenic 9mer peptides that contain a HLA-A2.1 binding motif. These peptides bind HLA-A2.1 and have a binding affinity of at least 1% as compared to a reference peptide (R71293). R59233 has an IC50 of 0 and the sequence occurs at position 614 in the HIV POL protein. The peptides of the invention can induce cytotoxic T lymphocytes which can react with target cells. They can be used for the treatment or prophlyaxis of cancer, eg. prostate cancer or lymphoma, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Hepatitis B virus polymerase; cytotoxic T cell response; prophylactic; vaccine; chronic; acute HBV infection; carrier.

The sequence encoding the jojoba embryo long chain fatty acyl-CoA reductase may be used in recombinant constructs which in turn can be used to transform E. coli. Such constructs are useful for the expression of the jojoba embryo long chain fatty acyl CoA reductase in host cells. The enzyme catalyses the formation of a fatty alcohol from a fatty acyl substrate. Analysis of the enzyme by SDS PAGE gave two prominent bands having apparent molecular masses of approximately 52 and 54 kb. As the apparent size of the reductase enzyme in the native state is approximately 49 kb as determined by size exclusion chromatography, these bands probably represented two related forms of the enzyme instead of two different subunits of the enzyme. This sequence is a peptide fragment from the 54 kb protein.

Analysis of the enzyme by SDS PAGE gave two prominent bands having apparent molecular masses of approximately 52 and 54 kb. As the apparent size of the reductase enzyme in the native state is approximately 49 kb as determined by size exclusion chromatography, these bands probably represented two related forms of the enzyme instead of two different subunits of the enzyme. This sequence is a peptide fragment from the 56 kb protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New recombinant constructs for transforming plants of E. colicontg. nucleic acid encoding jojoba embryo long chain fatty acyl-CoA reductase.

                                                                                                                                                                                                                                                                       Peptides R70066-7 are control peptides in an assay for stimulation of cytocoxic T cells (CTLs) by epitopes from the hepatitis B virus (HBV) polymerase (HBpol) (see R700044-59). The HBpol peptides can be used, prophylactically as vaccines, together with, or conjugated to, HBV helper epitopes (R70066-4). The peptides can be used, particularly ex vivo, to stimulate CTL cells,which cells can be reintroduced into patients who have chronic or acute HBV infections or are carriers, especially in treatments to prevent conversion from acute to chronic infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequences shown in W70077 to W70086 represent methionyl-tRNA (Met-tRNA)
Sequences shown in W70077 to W70086 represent methionyl-tRNA (Met-tRNA)
Synthetase fragments from different bacterial species. These are used
for designing degenerate primers (W43887 to V43890) used for isolating
Wet-tRNA sythetase gene fragment by PCR from M. tuberculosis and M.
Met-tRNA sythetase under control of transcriptional signals that can be
to used to transform sultable host cells. The nucleict acids and host cells
Wet-tRNA) synthetases, especially of methionyl tRNA synthetase. The enzymes are
to used for the recombinant production of mycobacterial amino acyl tRNA
Synthetases, especially of methionyl tRNA synthetase. The enzymes are
used by the organism in protein synthesis, and as such, the recombinant
consyme can be used to identify candidate drugs for use as antibiotics
towards mycobacteria, especially M. tuberculosis, which is responsible
for tuberculosis. Antisense constructs of the nucled acids can also be
used in antisense inhibition of the synthetase gene. The recombinant
consyme allows quick assays in screening of antibiotics. Present testing
protocols involve exposing whole mycobacteria to candidate drugs and
seeing their effect. This is time consuming as the bacteria are generally
convert with nathemenic attains

The polypeptide should be at least 8 amino acids, 2 of which are anchor histocompatibility complex class I molecule and a carbohydrate molecule histocompatibility complex class I molecule and a carbohydrate molecule which is linked to an internal amino acid of the polypeptide extends beyond the groove. This stimulates T cells which are able to lyse specifically cells that express carbohydrate residues on their surface.
                                                                                                                                                                                                                                                              Carbohydrate-specific; cytolytic T cell; therapeutic; tumour; major histocompatibility complex; vaccine; protective immune response; pathogenic bacteria; virus; CTL response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The polypeptides are used as vaccines to generate therapeutic or protective immune responses, particularly against tumours but also against pathogenic bacteria and viruses (e.g. mycobacteria that cause
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Composition for stimulating carbohydrate-specific cytotoxic T
lymphocytes - comprises synthetic peptide with attached carbohydrate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The patent discloses specific truncated BAX (tBAX) proteins which inhibit neuronal apoptosis induced by trophic factor deprivation. The anti-apoptotic taxx proteins include tBAX70. tBAX78 and their mutants. These proteins contain the N-terminal region and at least a portion of the BH3 domain of BAX alpha and lack the BH1. BH2 and C-terminal transmembrane domains. The tBAX protein lacking only the transmembrane domain has been shown to have anti-apoptotic activity. The tBAX proteins are used to treat diseases associated with neuronal apoptosis, e.g. neurodegenerative diseases, peripheral nerve injury, spinal cord injury, head trauma and stroke. tBAX proteins truncating at amino acid 68 of the BH3 domain of BAX alpha also have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     anti-apoptotic activity because Asp at position 68 is shown to be important for BAX activity and is conserved in all BCL-2 family members. The present sequence is a BH3 domain of mouse BAK protein, a pro-apoptotic protein belonging to BCL-2 family that is involved in regulation of neuronal programmed cell death. The present sequence contains the conserved Asp residue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            {\tt Truncated} BAX polypeptides useful for preventing apoptosis of neurons for the treatment of nervous system disorders ^{\text{-}}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     h 44.4%; Score 20; DB 21; Length 9; Similarity 57.1%; Pred.
